Lecture 2: Data Manipulation

INFO 1998: Introduction to Machine Learning

CDS Education

We explore, learn, and educate big minds.

Logistical Stuff

- Everyone should be enrolled in Student Center very soon (if not already)! Please check if you are enrolled in **INFO 1998 Section 602 for 1 credit S/U**.

Ask yourself:

- Can you access CMS?
- Can you access the Ed Discussion?
- Can you access the course website?
- Can you access the first assignment?
 - Due **TODAY 11:59pm**, submitted via CMS!
- A2 released! **Due Friday, March 1st**
 - 2 days later than usual because of February break
- OH cancelled from this Friday till next Tuesday (will announce on EdStem)

Agenda

1. **Define Good Question + Get Raw Data**
2. **Data Manipulation Techniques**
3. **Data Imputation**
4. **Other Techniques**
5. **Demo + Summary**

Define Good Question + Get Raw Data

Creating A Good Question

Good Examples:

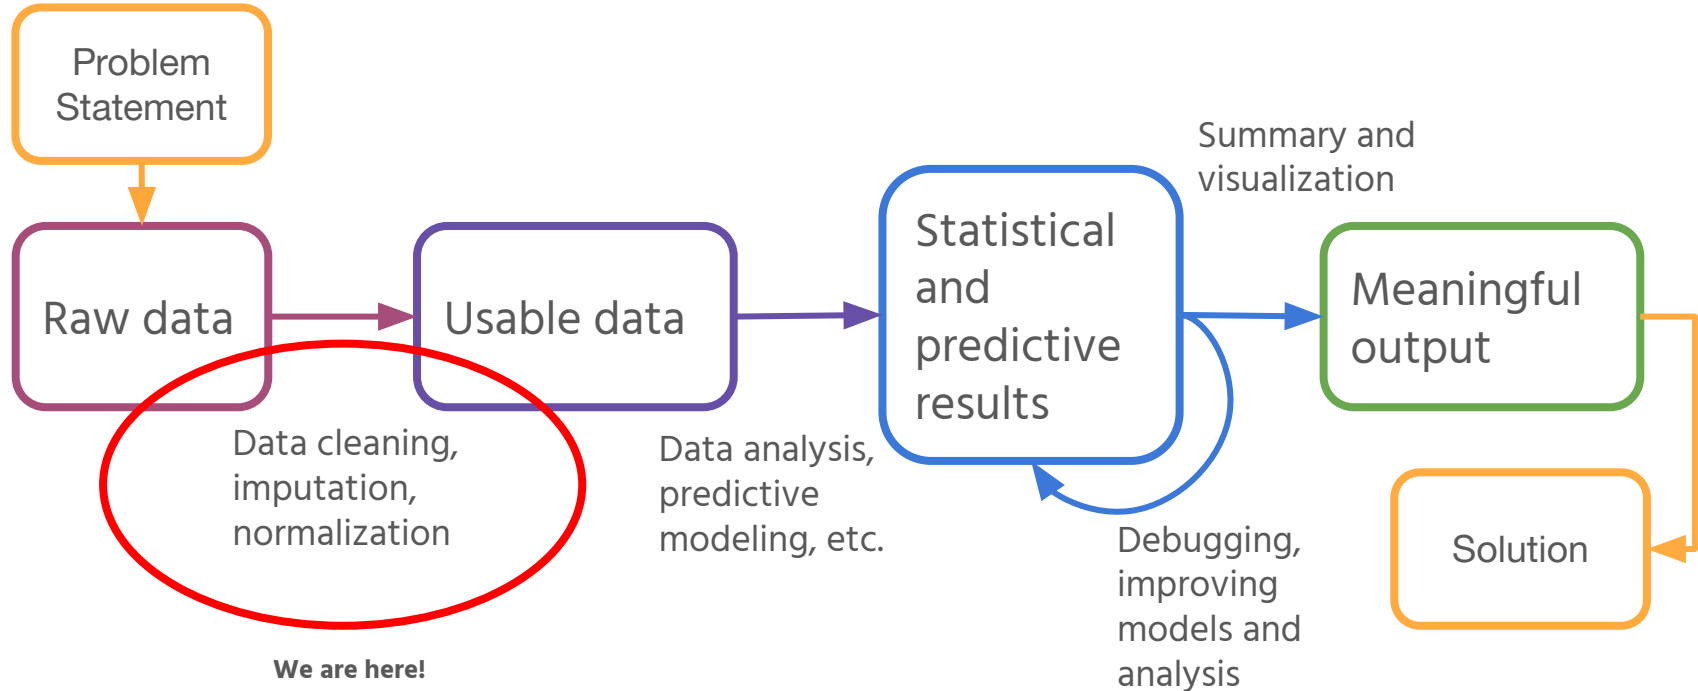

- What work and lifestyle conditions greatly impact mental health, and in what way?
- Based on this data, what factors can be used to predict a candidate's success within a Canadian election?
- What features best predict the amount of solar radiation the Earth gets based on data collected by NASA?

Poor Examples:

- What can the data tell me about mental health?
- Is there a relationship between the data and a candidate's success in a Canadian election?
- Can we predict amount of solar radiation the earth gets?

The Data Pipeline

Acquiring data

- **Option 1:** Web scraping directly from web with tools like [BeautifulSoup](#)
 - **Option 2:** Querying from databases
 - **Option 3:** Downloading data directly (ex. from Kaggle/Inter-governmental organizations/Govt./Corporate websites)
- ...and more!

Finding a Relevant Dataset

Questions to Ask Yourself...

- Does the data measure what you care about?
- Is your data connected/related?
- Do you have a lot of data?

How does input data usually look?

Timestamp,Class Year:,Major:,"On a scale 1 to 5 (1=unfamiliar, 5=proficient) , how well do you know Python?",How did you hear about this class?,"We will hold some optional workshops to dive deeper into industry applications of advanced analytics, and any other topics that might be of interest to you (eg. Data Scrapping). What are some workshops you would like to attend? Anything goes.",What is a data problem that interests you the most?
 2/9/20 0:26,2020,MBA,1,Referral by Friend,Tensorflow,A/B testing and setting up experiments
 2/10/20 16:33,2023,Computer Science,1,In-class advertisement,"Website Analytics, Sentiment Analysis, Cleaning Data",How can we design efficient metrics to gauge performance of any type of data?
 2/11/20 8:26,2022,MechE,1,In-class advertisement,,I would like to know more about how computational methods are used in engineering or physics researches.
 2/11/20 22:43,2023,ILR,1,Referral by Friend,,The ethics behind data sharing and privacy laws online
 2/12/20 17:41,2023,Food Science,1,Referral by Friend,"artificial intelligence human behavior

- Usually saved as .csv or .tsv files
- Known as **flat text files**, require parsers to load into code

	Timestamp	Class Year:	Major:	On a scale 1 to 5 (1=unfamiliar, 5=proficient) , how well do you know Python?	How did you hear about this class?	We will hold some optional workshops to dive deeper into industry applications of advanced analytics, and any other topics that might be of interest to you (eg. Data Scrapping). What are some workshops you would like to attend? Anything goes.	What is a data problem that interests you the most?

However...

Most datasets are **messy**.

Datasets can be **huge**.

Datasets **may not make sense**.

Question

What are some ways in which data can be “*messy*”?

Survey Time!

Examples of Weird Data

From the onboarding form!

Example 1: Let's find CS majors in INFO 1998.

Different cases:

- Computer Science
- CS
- Cs
- computer science
- CS and Math
- OR/CS

...goes on

Example 2: From INFO 1998

Example answers for 'What Year Are You?'

- 2002
- 1st
- Junor
- INFO SCI 2026

...goes on

Data Manipulation Techniques

Why should we manipulate data?

Ease of Use

Prevent calculation
errors

Improve memory
efficiency

DataFrames!

- **Pandas** (a Python library) offers **DataFrame** objects to help manage data in an orderly way
- Similar to Excel spreadsheets or SQL tables
- DataFrames provides functions for selecting and manipulating data

```
import pandas as pd
```

Data Manipulation Techniques

- Filtering & Subsetting
- Concatenating
- Joining
- *Bonus*: Summarizing

Filtering vs. Subsetting

- Filters **rows**
- Focusing on data entries

Name	Year	Major
Varun	2024	CS
Deniz	2026	CS
Mahi	2025	ORIE
Eric	2024	Math

Filtering

- Subsets **columns**
- Focusing on characteristics

Name	Year	Major
Varun	2024	CS
Deniz	2026	CS
Mahi	2025	ORIE
Eric	2024	Math

Subsetting

Joining

Joins together two data frames on any specified key (fills in NaN = Not a Number otherwise). The index is the key here.

	Name
0	Varun
1	Deniz
2	Mahi
3	Eric
4	Jerry

	Age	Major
0	20	CS
1	19	CS
3	21	Math

	Name	Age	Major
0	Varun	20	CS
1	Deniz	19	CS
2	Mahi	NaN	NaN
3	Eric	21	Math
4	Jerry	NaN	NaN

```
DataFrame.join(other, on=None, how='left', lsuffix='', rsuffix='', sort=False)
```

Types of Joins

ID	X1	ID	X2
1	a1	2	b1
2	a2	3	b2

Inner Join

ID	X1	X2
2	a2	b1

Outer Join

ID	X1	X2
1	a1	NA
2	a2	b1
3	NA	b2

Left Join

ID	X1	X2
1	a1	NA
2	a2	b1

Right Join

ID	X1	X2
2	a2	b1
3	NA	b2

Concatenating

Combines together two data frames, either row-wise or column-wise

Name	Sex	Major
Varun	M	CS
Eric	M	Math

Name	Sex	Major
Mahi	F	ORIE
Deniz	F	CS

Name	Sex	Major
Varun	M	CS
Eric	M	Math
Mahi	F	ORIE
Sam	F	CS

```
pandas.concat(objs, axis=0, join='outer', ignore_index=False, keys=None, levels=None, names=None, verify_integrity=False, sort=False, copy=True)
```

Bonus: Summarizing

- Gives a quantitative overview of the dataset
- Useful for understanding and exploring the dataset!

```
>>> s = pd.Series([1, 2, 3])
>>> s.describe()
count      3.0
mean       2.0
std        1.0
min        1.0
25%        1.5
50%        2.0
75%        2.5
max        3.0
dtype: float64
```

```
>>> s = pd.Series(['a', 'a', 'b', 'c'])
>>> s.describe()
count      4
unique      3
top         a
freq        2
dtype: object
```

Above: stats made easy

Data Imputation

Dealing with missing data

Datasets are usually incomplete. We can solve this by:

Leaving out samples
with missing data

Data imputation

Randomly Replacing NaNs

Using summary statistics

Using predictive models

1: Leaving out samples with missing values

- Option: Remove NaN values by removing specific samples or features
- **Beware** not to remove too many samples or features!
 - Information about the dataset is lost each time you do this

Question: How much is too much?

2: Data Imputation

3 main techniques to impute data:

1. Randomly replacing NaNs
2. Using summary statistics
3. Using regression, clustering, and other advanced techniques

2.1: Randomly replacing NaNs

- **This is not good - don't do it**
- Replacing NaNs with random values adds unwanted and unstructured noise

2.2: Using summary statistics

non-categorical data

- Works well with small datasets
- Fast and simple
- Does not account for correlations & uncertainties
- e.g. mean vs. median, average

categorical data

- Using mode works with categorical data (only theoretical)
- But it introduces **bias** in the dataset

```
>> an_array.mean(axis=1) # computes means for each row
```

```
>> an_array.median() # default is axis=0
```

2.3: Using Regression / Clustering

- Use other variables to predict the missing values
 - Through regression, clustering, KNN...
- Doesn't include an error term, so it's not clear how confident the prediction is

Other Techniques

Technique 1: Binning

What?

Makes continuous data categorical by lumping ranges of data into discrete “levels”

Why?

Applicable to problems like (third-degree) price discrimination

Technique 2: Normalizing

What?

Turns the data into values between 0 and 1

Why?

Easy comparison between different features that may have different scales. Necessary for models with distance metrics.

Technique 3: Standardizing

What?

Turns the data into a normal distribution with mean = 0 and SD = 1

Why?

Meet model assumptions of normal data; act as a benchmark since the majority of data is normal; curving grades.

Standardizing

Log transformation

Others include square root, cubic root, reciprocal, square, cube...

Technique 4: Ordering

What?

Converts categorical data that is inherently ordered into a numerical scale

Why?

Numerical inputs often facilitate analysis

Example

January → 1
February → 2
March → 3
...

Technique 5: Dummy Variables

What?

Creates a binary variable for each category in a categorical variable

plant	is a tree
aspen	1
poison ivy	0
grass	0
oak	1
corn	0

Technique 6: Feature Engineering

What?

Generates new features which may provide additional information to the user and to the model

Why?

You may add new columns/dimensions of your own design to derive more meaningful relationships in your analysis!

ID	Num
0001	2
0002	4
0003	6

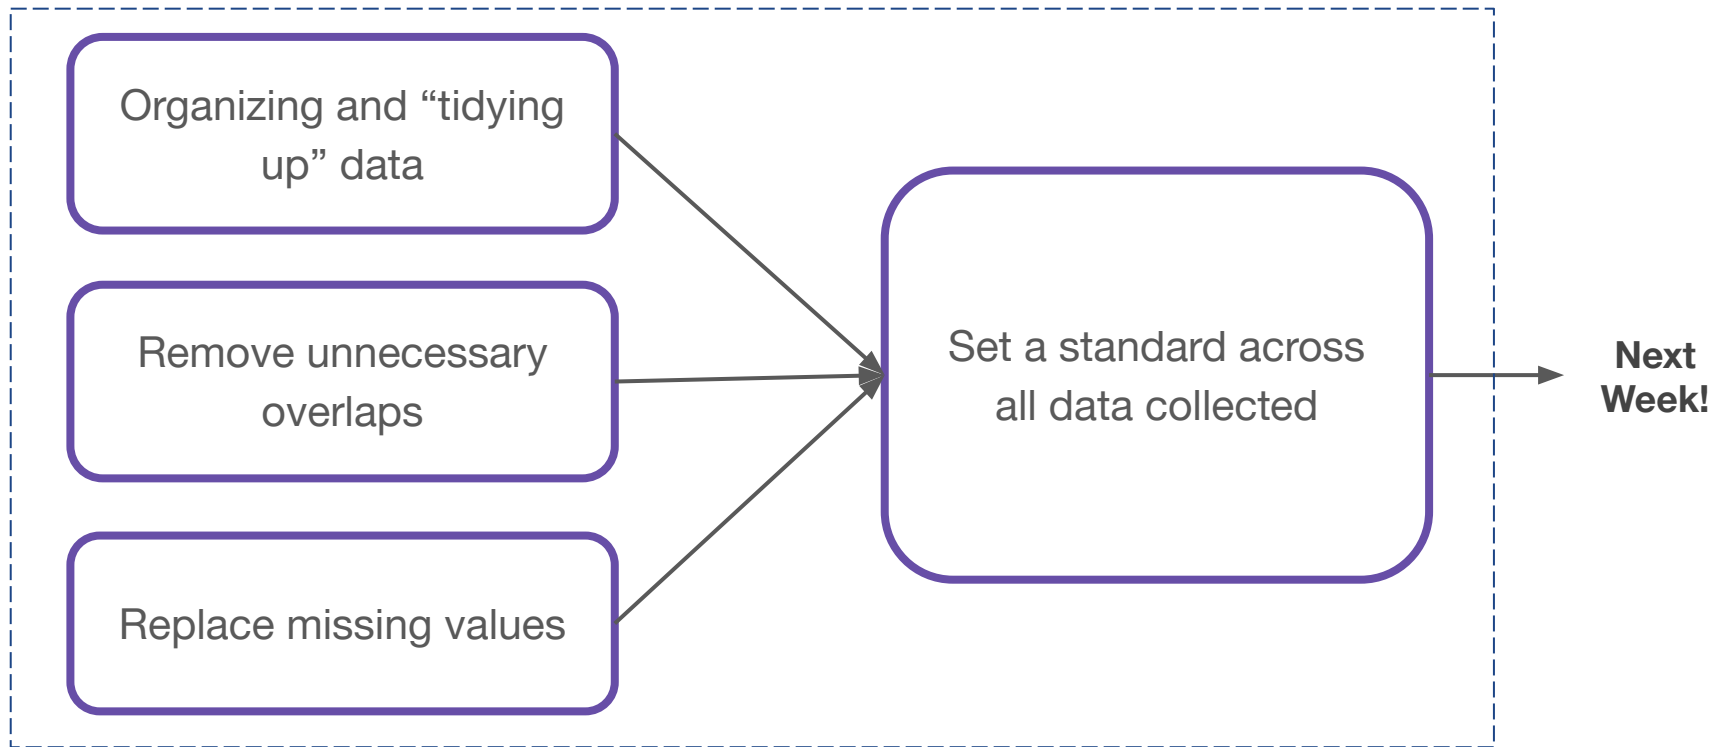

ID	Num	Half	SQ
0001	2	1	4
0002	4	2	16
0003	6	3	36

Example: Feature Engineering

Summary

Today

Demo

Coming Up

- **Assignment 2:** Due at 11:59pm on Friday, March 1st
- Submit **Assignment 1** by tonight!
- **Next Lecture:** Data Visualization
- Start thinking about project groups! Feel free to group up after class or send out potential project ideas on Ed!

Have a great February Break :)
