## **INFO 1998: Introduction to Machine Learning**

## **Lecture 2: Data Manipulation**

**INFO 1998: Introduction to Machine Learning** 

## **Agenda**

- 1. How to Define a Good Question
- 2. The Data Pipeline/Datasets
- 3. Data Manipulation Techniques
- 4. Data Imputation
- 5. Other Techniques

## **Creating A Good Question**

#### **Good Examples:**

- What work and lifestyle conditions greatly impact mental health, and in what way?
- Based on this data, what factors can be used to predict a candidate's success within a Canadian election?
- What features best predict the amount of solar radiation the Earth gets based on data collected by NASA?

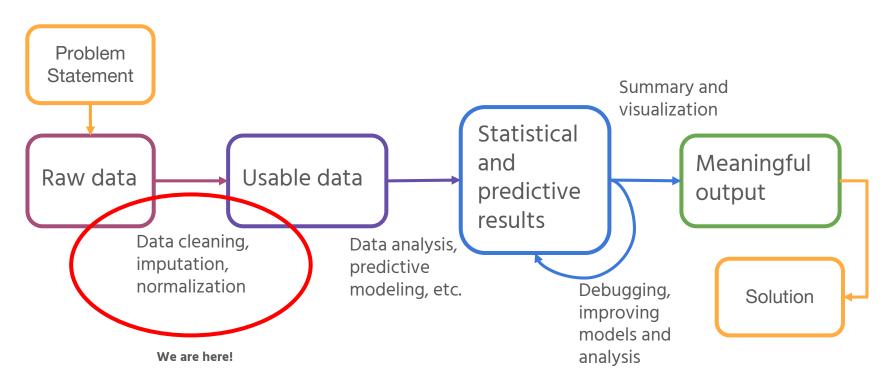

#### **Poor Examples:**

- What can the data tell me about mental health?
- Is there a relationship between the data and a candidate's success in a Canadian election?
- Can we predict amount of solar radiation the earth gets?

## The Data Pipeline

## **Acquiring data**

- Option 1: Web scraping directly from web with tools like <u>BeautifulSoup</u>
- Option 2: Querying from databases
- Option 3: Downloading data directly (ex. from Kaggle/Inter-governmental organizations/Govt./Corporate websites)

...and more!

## Finding a Relevant Dataset

#### Questions to Ask Yourself...

- Does the data measure what you care about?
- Is your data connected/related?
- Do you have a lot of data?

https://www.kaggle.com/datasets

### How does input data usually look?

Timestamp, Class Year:, Major:, "On a scale 1 to 5 (1=unfamiliar, 5=proficient), how well do you know Python?", How did you hear about this class?, "We will hold some optional workshops to dive deeper into industry applications of advanced analytics, and any other topics that might be of interest to you (eg. Data Scraping). What are some workshops you would like to attend? Anything goes.", What is a data problem that interests you the most?

2/9/20 0:26,2020,MBA,1,Referral by Friend,Tensorflow,A/B testing and setting up experiments

2/10/20 16:33,2023,Computer Science,1,In-class advertisement,"Website Analytics, Sentiment Analysis, Cleaning Data",How can we design efficient metrics to gauge performance of any type of data?

2/11/20 8:26,2022, MechE, 1, In-class advertisement, I would like to know more about how computational methods are used in engineering or physics researches.

2/11/20 22:43,2023,ILR,1,Referral by Friend,,The ethics behind data sharing and privacy laws online

2/12/20 17:41,2023,Food Science,1,Referral by Friend,"artificial intelligence

human behavior

- Usually saved as .csv or .tsv files
- Known as flat text files, require parsers to load into code

1	Timestamp	Class Year:	Major:	On a scale 1 to 5 (1=unfamiliar, 5=proficient) , how well do you know Python?	How did you hear about this class?	We will hold some optional workshops to dive deeper into industry applications of advanced analytics, and any other topics that might be of interest to you (eg. Data Scraping). What are some workshops you would like to attend? Anything goes.	What is a data problem that interests you the most?
2	2/9/20 0:26	2020	MBA	1	Referral by Friend	Tensorflow	A/B testing and setting up experiments
	2/10/20 16:33	2023	Computer Science	1	In-class advertisement	Website Analytics, Sentiment Analysis, Cleanin	How can we design efficient metrics to gauge p
	2/11/20 8:26	2022	MechE	1	In-class advertisement	NaN	I would like to know more about how computatio
	2/11/20 22:43	2023	ILR	1	Referral by Friend	NaN	The ethics behind data sharing and privacy law
	2/12/20 17:41	2023	Food Science	1	Referral by Friend	artificial intelligence \nhuman behavior\necon	how to predict human behavior using internet d

### **So...**

Most datasets are **messy**.

Datasets can be huge.

Datasets may not make sense.

# Question

What are some ways in which data can be "messy"?

### **Examples of Drunk Data**

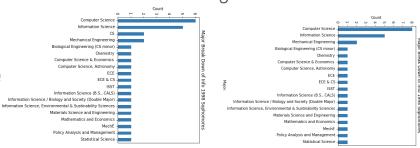

From the onboarding form!

**Example 1**: Let's find CS majors in INFO 1998.

Different cases:

- Computer Science
- CS
- Cs
- computer science
- CS and Math
- OR/CS

#### **Example 2:** From INFO 1998 (Fall '18)

Answers for 'What Year Are You?'

- 1999
- 1st Master
- Junor
- INFO SCI

...goes on

## Why we manipulate data?

Ease of Use

Prevent calculation errors

Improve memory efficiency

### **DataFrames!**

- Pandas (a Python library) offers
   DataFrame objects to help
   manage data in an orderly way
- Similar to Excel spreadsheets or SQL tables
- DataFrames provides functions for selecting and manipulating data

import pandas as pd

## **Data Manipulation Techniques**

- Filtering & Subsetting
- Concatenating
- Joining
- Bonus: Summarizing

## Filtering vs. Subsetting

- Filters rows
- Focusing on data entries

Name	Age	Major	
Chris	21	Sociology	
Tanmay	21	Information Science	
Sam	18	ECE	
Dylan	20	Computer Science	

Subsets columns

Focusing on characteristics

Name	Age	Major
Chris	21	Sociology
Tanmay	21	Information Science
Sam	18	ECE
Dylan	20	Computer Science

## **Concatenating**

Joins together two data frames, either row-wise or column-wise

Name	Age	Major
Chris	21	Sociology
Jiunn	20	Statistics

Name	Age	Major	
Lauren	19	Physics	
Sam	17	ECE	

Name	Age	Major
Chris	21	Sociology
Ethan	20	Statistics
Lauren	19	Physics
Sam	18	ECE

## **Joining**

Joins together two data frames on any specified key (fills in NaN otherwise). The index is the key here.

	Name
0	Ann
1	Chris
2	Dylan
3	Camilo
4	Tanmay

	Age	Major
0	19	Computer Science
1	20	Sociology
2	19	Computer Science

	Name	Age	Major
0	Ann	19	Computer Science
1	Chris	20	Sociology
2	Dylan	19	Computer Science
3	Camilo	NaN	NaN
4	Tanmay	NaN	NaN

# **Types of Joins**

## **Bonus: Summarizing**

- Gives a quantitative overview of the dataset
- Useful for understanding and exploring the dataset!

```
>>> s = pd.Series([1, 2, 3])
>>> s.describe()
count    3.0
mean    2.0
std    1.0
min    1.0
25%    1.5
50%    2.0
75%    2.5
max    3.0
dtype: float64
```

```
>>> s = pd.Series(['a', 'a', 'b', 'c'])
>>> s.describe()
count    4
unique    3
top     a
freq    2
dtype: object
```

Above: stats made easy

## **Dealing with missing data**

Datasets are usually incomplete. We can solve this by:

Leaving out samples with missing data

Data imputation

Randomly Replacing NaNs

Using summary statistics

Using predictive models

## 1: Leaving out samples with missing values

- Option: Remove NaN values by removing specific samples or features
- Beware not to remove too many samples or features!
  - Information about the dataset is lost each time you do this
- Question: How much is too much?

## 2: Data Imputation

3 main techniques to impute data:

- 1. Randomly replacing NaNs
- 2. Using summary statistics
- 3. Using regression, clustering, and other advanced techniques

## 2.1: Randomly replacing NaNs

- This is not good don't do it
- Replacing NaNs with random values adds unwanted and unstructured noise

## 2.2: Using summary statistics (non-categorical data)

- Works well with small datasets
- Fast and simple
- Does not account for correlations & uncertainties
- Usually does not work on categorical features

```
>> an_array.mean(axis=1) # computes means for each row
```

```
>> an_array.median() # default is axis=0
```

## 2.2: Using summary statistics (categorical data)

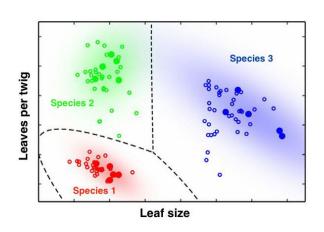

- Using mode works with categorical data (only theoretical)
- But it introduces bias in the dataset

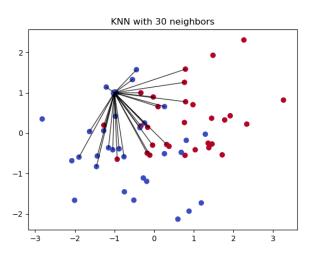

## 2.3: Using Regression / Clustering

- Use other variables to predict the missing values
  - Through either regression or clustering model
- Doesn't include an error term, so it's not clear how confident the prediction is

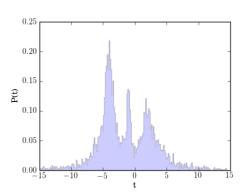

## **Technique 1: Binning**

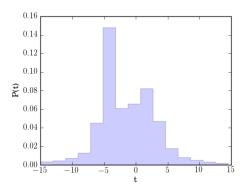

What?

Makes continuous data categorical by lumping ranges of data into discrete "levels"

Why?

Applicable to problems like (third-degree) price discrimination

## **Technique 2: Normalizing**

What?

Turns the data into values between 0 and 1

Why?

Easy comparison between different features that may have different scales

## **Technique 3: Standardizing**

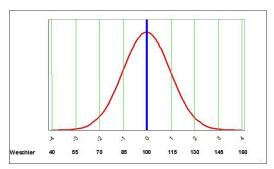

What?

Turns the data into a normal distribution with mean = 0 and SD = 1

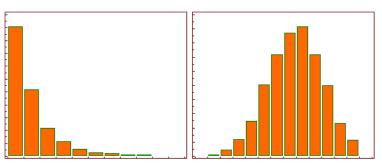

Why?

Meet model assumptions of normal data; act as a benchmark since the majority of data is normal; wreck GPAs

Standardizing

Log transformation

Others include square root, cubic root, reciprocal, square, cube...

## **Technique 4: Ordering**

What?

Why?

**Example** 

Converts categorical data that is inherently ordered into a numerical scale

Numerical inputs often facilitate analysis

January  $\rightarrow$  1 February  $\rightarrow$  2 March  $\rightarrow$  3

## **Technique 5: Dummy Variables**

What?

Creates a binary variable for each category in a categorical variable

plant	is a tree
aspen	1
poison ivy	0
grass	0
oak	1
corn	0

## **Technique 6: Feature Engineering**

What?

Generates new features which may provide additional information to the user and to the model

Why?

You may add new columns of your own design using the assign function in pandas

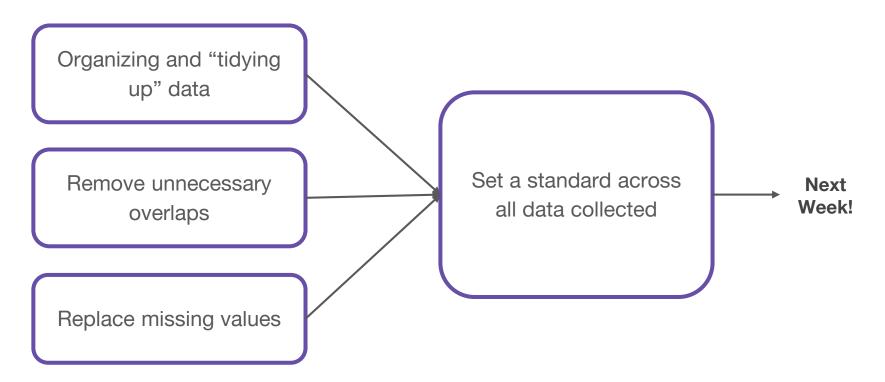

ID	Num	
0001	2	
0002	4	
0003	6	

ID	Num	Half	SQ
0001	2	1	4
0002	4	2	16
0003	6	3	36

## **Summary**

# **Demo**

## **Coming Up**

- Assignment 2: Due at 4:30pm on October 6th, 2021
- Next Lecture: Data Visualization
